

The influence of rhythm pattern

- ☐ **The study selected 2/4, 3/4, 4/4 and 6/8 beats as experimental variables.**
- ☐ **Among them, 4/4 beats had the highest scores on arousal and pleasure, and only 4/4 beats produced significant positive stimulation of bilateral superior temporal gyrus and left auxiliary motion area.**
- ☐ **Several other experiments have shown similar results, presumably because 4/4 beat is most common in popular music. Musical familiarity is higher, resulting in a more pronounced emotional response from listeners.**
